

Assignment 2A

YACKS!!

Problem Statement

People with chronic conditions struggle to identify meaningful patterns in their health because their data is scattered across multiple platforms like wearable devices, health apps, and personal journals. While current tools allow users to track symptoms and lifestyle factors, they are largely reactive and do not effectively help users connect trends over time. Additionally, many AI-driven health tools provide generalized insights that fail to reflect the highly individualized nature of chronic illnesses, limiting their usefulness for personal decision-making.

Target User Group

The target users are individuals with chronic physical conditions who regularly track symptoms, medications, and lifestyle factors. These users often develop a deep understanding of their bodies through experience and research, but lack tools to synthesize their data into meaningful, personalized insights to better manage their condition.

Heartbeat sensor

EMA

Running club

Chatting with neighbor

Pattern Recognition via AI

Connecting with providers

Getting patterns of their health data
adjust lifestyle

Tailor personalized treatment

Form: Apple watch integration

Can track HR and effort
- workout plans?

Form: Phone + apple watch

Interactions - Patient to doctor

PDF?
excel?

Interactions - Friends to user

Congratulate!

Feature - data exporting

Feature - AI

blat blab

Tasks - track symptoms

Tasks - view data/trends

easy download!

interactions

doctor

easy meeting

alerts!!

features

Cross platform merging

identify triggers

tasks

super easy!

device assistant
tracks what you're
doing

alarm that dispenses
pills and doesn't stop
till user takes them

adopt-a-tree. if
u log in and track, your
plant/tree gets watered

doctor can see your
past month and
see the what changes

~~scribbled out text~~

~~scribbled out text~~

LEADERBOARD

compete w/
friends

mini robot device

mini robot that
dispenses pill so user
stays consistent

Partnership w/ user's
choice of vech. At a
month of consistent
tracking, they get free
ice cream.

LOUD SPEAKER at night
that only turns off
once you log your
day.

App on a phone

App on a smartwatch

Conversation between patient (left) and doctor (right)

Conversation about accommodations in the workplace

Logging daily check-in via voice conversation with AI

View trends and correlations of condition and daily life

Establish a personalized baseline

Proactive flare-up mitigation (e.g. reschedule high-stress meeting because of trend detected by AI)
