

Design Research Plan

Yi Zeng, Anabelle Martin, Claudia Soebagijo, Kevin Wu, Sahana Hegde

1. Describe the people who might use your design and other stakeholders to consider in your design - Yi

The potential users for our design are people with chronic illnesses who want to identify lifestyle changes, triggers, and trends based on their daily health data to improve their quality of life, as well as the health providers that treat such patients in the Seattle area. Our design helps users to collect their data relating to their conditions, such as cardiovascular risk factors, through multiple ways, for instance, passive sensing. On the one hand, our design could analyze data specific to users to identify certain trends and patterns so that users could adjust their lifestyles or behaviors accordingly. On the other hand, trends and patterns from user data could also inform their health providers to develop more effective and tailored treatment options.

2. Two Specific Design Methods you will use to engage with and learn from these people - Anna

Design method 1 - interviews:

This would give us knowledge about day-to-day experiences. It is hard to gain a full picture of living with a chronic condition through just observation. Many people learn to adapt to it, and observing when it does affect the person would most likely be intrusive. We would learn about daily struggles, adaptations, and quality of life, as well as what sort of resources would help with that.

Design method 2 - social media storytelling survey (public survey / graffiti wall):

We would post on a social media platform, such as Reddit, asking/surveying people with chronic conditions about their experiences. This would give us feedback and knowledge of experiences from a broader collection of people, how they would use a platform like this one, and what they would want out of it. We would ask story prompting questions (Ex. What has your experience with doctors been like?), which gets rid of the general/shallow nature of normal surveys.

Note that these methods are self-reporting. Self-reported experiences would be useful because, for the most part, people with chronic conditions are aware of the

limiting factors of their conditions and how they have adapted to accommodate them.

Interviews and **social media storytelling surveys** would be the most valuable for this project at this point.

Interview Script

“Hi! Thank you so much for taking the time to talk with us today. We are currently enrolled in a User Interaction CS class, working on a project to improve how people with chronic conditions track and understand their health data. This interview is just to learn about your experiences, and there are no right or wrong answers. Do you mind if we take notes while we talk?”

- *“Can you tell me a little about your condition and what how long you have been managing it?”*
- *“What kind of tools or methods do you currently use to track your health?”*
- *“Whats the most frustrating part about tracking your health right now?”*

3. Describe how many participants you are planning to recruit for each research method. - Kevin

We plan to conduct interviews for at least two participants. For the social media storytelling survey, we plan to post on public forums such as Reddit to get at least ten respondents.

4. Describe who in your team will perform which role during the research - Claudia

For our interview research session, *Anna* and *Kevin* would be in charge of conducting the interview, with *Kevin* being the lead interviewer. Along with the two of them, *Claudia* would be the note-taker present during the interview. Our other research session would be a social media storytelling survey, in which *Sahana* and *Yi* would be in charge of posting questions and prompts on social media forums and drawing insights from the survey (social media posts).
