

2D Task Analysis

Yi Zeng, Annabelle Martin, Claudia Soebagijo, Kevin Wu, Sahana Hegde

Existing Tasks

Easy - Medication reminder and summary

Taylor is a software engineer in his mid 30s and has had chronic shoulder pain for the last 4 years from a car accident. He has tried multiple approaches to manage his condition, such as pain medication and physical therapy. Those treatments work for the most of the time. However, recently he has been taking pain medication on and off because of his work schedule shift. The type of medication prescribed to him requires a specific timing and it's usually during his work time, so he frequently forgets to take the meds. Such inconsistency causes him to have flare-ups. He is looking for an integrative application that could remind him to take meds at specific times as well as easier to review which period he has been consistently taking the meds. Therefore, he could present those results to his provider to adjust treatment plans.

Medium - Log symptoms, normally and during flare-ups

Elizabeth is a 21 year old, recently diagnosed with POTS. She wants to learn about how her condition affects her day-to-day by acquiring and compiling long-term data with context. She decides to track what days she does workouts, walks, the daily high temperature, along with how she feels daily on a scale of 1-10. She enjoys logging her data, but her main goal is to find trends and patterns in the data. She likes that she can define what a 1 through 10 day looks like for her, since previous scales, such as the 1-10 pain scale never really made sense to her. She doesn't like filling out long forms, so decides to only track these few things, instead of also tracking medication, stress, sleep, etc. During bad days, she often does not feel like logging, so she goes back and retroactively logs her information when she feels like returning.

Hard - Communicating full impact of conditions to their doctors

Rachel has spent years dealing with chronic nerve pain for the past three years. Throughout that time, she has seen multiple doctors from multiple fields of medicine and have gotten different diagnoses. However, none of these diagnoses have actually fully explained her symptoms. She leaves appointments frustrated and misunderstood, wondering if these diagnoses are due to her not being able to communicate her experience clearly enough. She has an upcoming appointment with a new specialist, and she's hoping to finally get an accurate diagnosis. She tries to prepare for it by recalling what her symptoms are and when they started, and what seems to trigger them. But, she has a hard time describing her experience using standard pain scales because her pain varies widely in intensity and how it affects her daily

ability to function. She is worried that if she misses important details, she may once again be misdiagnosed.

New Tasks

Easy - View Trend/Trigger Analyses, Predictions, and Recommendations

Maya is a 20-year-old college student managing chronic abdominal pain and fatigue. Lately, she has been feeling discouraged because her crashes seem to happen at random, forcing her to cancel plans with friends and fall behind on her coursework. She suspects her diet and sleep patterns are contributors, but she can't pinpoint the exact link amidst the stress of school. On a Tuesday morning, Maya wants to know if she is at high risk for a flare-up later in the week so she can decide whether to front-load her homework or ask for an extension now. She looks for an analysis of her recent data to see if her late-night study sessions or recent meals have historically preceded a crash. By understanding these correlations and seeing a forecast of and recommendations for her energy levels, Maya can make an informed choice to skip a social outing or adjust her diet to avoid a total physical collapse by Friday.

Medium - Explain conditions to friends, professors, or employees

Kristin deals with unpredictable pain and low energy that makes it difficult for her to follow through on her commitments. After missing a deadline due to a flare-up, Kristin needs to explain her situation to her professor. She struggles to describe how her condition affects her ability to complete work on time, especially because her symptoms are inconsistent and invisible. She wants to communicate her needs clearly so that she can be understood and receive appropriate flexibility. She also wants to be able to communicate her condition to her school friends that helps them understand why her availability changes and what kind of support she needs, without having to repeatedly justify herself or feel like she's letting others down.

Hard - Find personalized doctor (health summary), medical, and community resources

Chloe has spent years dealing with doctors who do not understand her specific symptoms. She needs to find a specialist who is known for treating her exact condition rather than just seeing whoever is available. To prepare for a visit, she wants to create a summary of her health data that shows how her pain actually stops her from doing things like painting or working in her lab. She also feels lonely and wants to find a community of people who have the same illness so she can share advice and feel less isolated. Finding the right doctor and a supportive group might help her finally get the right help.
